

Canine subject of remarkable ArthroPet® supplemental research study to be at Natural Products Expo West

The champion Airedale Terrier that was the subject of a long-term ArthroPet™ supplementation micro-research study yielding stunning results can be seen during the Natural Products Expo West, March 24th & 25th. Diagnosed with bilateral hip dysplasia in 1999, it was determined by the veterinary surgical examiner that the dog would face "significant osteophyte formation relatively soon" and surgery was recommended. Seven years following continual daily supplementation with ArthroPet™ made with kolla2®, x-rays of the

canine known as Blackjack MacIntrye, showed "definite filling in of bilateral femoral necks" and hip dysplasia had ceased its typical progression. An additional canine subject with osteoarthritis and a missing leg was placed on ArthroPet™ by his veterinarian and just six months later was found to have his comfort and mobility level "improved at least 75% over his

previous condition." The efficacy of ArthroPet™ has allowed Blackjack MacIntrye to resume clinically normal mobile activity. For more information call 951-600-3899 or visit www.collagennutra.com.
